

## Does AI(Artificial Intelligence) have a responsibility to help unemployment in society?

AI is able to reach a singular point to the program, learn, and implement itself. This is why people fear AI taking over most labor jobs, but I would have to disagree that AI is responsible for the growing unemployment in our society.

First, AI is not smart enough. The generations we live in currently are fast-developing technology, mainly depending solely on AI technology. Currently, AI is focused on allowing humans to be more productive and help make good decisions. But because it is so fast, companies that want to successively grow need to keep up with the program and retrain their employees. AI is not smart enough to do anything on its own to keep up with the fast-developing technology.

Secondly, AI technology is originally created and designed by a human. More productivity equals more employees. In most companies, they have the supplies but they need people who can work with AI. The necessary abilities needed in digital skills are algorithms and feeding data into the AI. We currently do not have enough technicians to build enough AI in order to overtake our jobs.

Lastly, it's all about "caring". AI can do unlimited amounts of possibilities and although it is very convenient, some jobs are better in the hands of humans. Some employments such as beauty stylists or hairdressers, nurses, and doctors, therapists, personal trainers, etc, require the abilities that AI lacks: "the heart" and care. Customers and clients can only gain this "caring" feeling from other humans.

Technology develops and changes very fast so it's very difficult to read what would happen with AI and unemployment in the next 20-30 years, but for now, it is less likely to lead to unemployment.
